EFDCPlus Documentation

Release 8.5.0

Zander Mausolff

Aug 28, 2019

CONTENTS:

CHAPTER ONE

INTRODUCTION

One of the purposes of this guide is to provide users and developers information about how to build, run, and develop the EFDC+ code. Additionally, there will be discussion on how to setup a basic EFDC+ model and post process the results. Finally, several sample EFDC+ models will be provided.

1.1 Getting Started

@todo put directions on how to obtain the EFDC+ source code, since we do not know exactly how this will work we will have to go back and fill this in. Likely, we can have this all on a git repository, thus we can provide directions here on how to clone the git repo.

After cloning the EFDC+ repository the following folders will be available under the root directory.

`EFDC` - Contains source code to build EFDC+, sample executables for different build options.

`NetCDFLib` - Necessary library files for building EFDC+ so it can write NetCDF files out.

`NetCDFDLL4.4.0` - @todo are these for 64 bit compilation?

`GridGenerator` - Contains the executable for the simple Grid Generator for EFDC+

`GetEFDC` - Contains source code for building utility that helps extract EFDC+ formatted binary time series data.

`WASP` - Provides some files necessary for linkage with the WASP code (advanced used feature).

`docs` - contains documentation for EFDC+.

The contents of each folder is described below:

```
EFDC/ -
        |-- DebugDP64/
                `-- *.dll
        |-- DebugSP/
                `-- *.dll
        |-- DebugSP64/
                `-- EFDC.exe
                `-- *.dll
        |-- ReleaseDP64/
                `--EFDC.exe
                `--*.dll
        |-- ReleaseSP/
                `-- EFDC.exe
                `-- *.dll
        |-- ReleaseSP64/
                `-- EFDC.exe
                `-- *.dll
```

(continues on next page)

(continued from previous page)

        `-- index.rst - Root RST file
        `-- license.rst
```

1.1.1 Build Instructions

Building EFDC+ from the source code is most easily carried out with Visual Studio (VS). The Intel Fortran compiler is the preferred compiler and the most tested for building EFDC+. The simplest build method is to open the VS solution file that comes with the source code. The solution file is located in the root directory of the `EFDC` folder and will have the '.sln' extension. The following discussion assumes the user is running Windows 7 (or greater) and has access to Visual Studio 2015 (or greater). These tools have been most throughly tested. However, it is likely that EFDC+ can be built with other versions of the Intel compiler and Visual Studio.

In addition to the source code, pre-built executables are available under each of the following folders:

- EFDC/DebugSP64/

- EFDC/ReleaseDP64/
- EFDC/ReleaseSP/
- EFDC/ReleaseSP64/

Next, the differences in each of the build configurations will be explained.

Build Configurations

The different build configurations are managed by VS. Visual studio provides a convenient way for maintaining different build configurations for the same project. The build configurations can be inspected by clicking the *Project* tab in the top of VS and selecting *properties*. Each of the build configurations is listed below:

- DEBUG SP
- DEBUG SP 64
- DEBUG DP
- DEBUG DP 64
- Release SP
- Release SP 64
- Release DP
- Release DP 64

For each of the bulleted build configurations listed above, if *64* is not specified, the executables is assumed to be compiled for a 32 bit system. The table below explains the shorthand used to signify the differences in build configurations.

SP	Single Precision
DP	Double Precision
64	64 bit compilation

OpenMP Compilation

Compilation of EFDC+ with OpenMP allows multithreading, which typical results in a reduction of the total calculation time. The build configuration requires specifying several things in the VS *Properties* page. These settings are already configured in the builds provided. However, the details are given below in case a user wants to make modifications or use an OpenMP library besides Intel's.

Under: Fortran\Preprocessor

OpenMP Conditional Compilation	Yes

Under: Fortran\Preprocessor

Process OpenMP Directives	Generate Parallel Code (/Qopenmp)

Under: Fortran\Libraries

Runtime Library	Multithreaded DLL (/libs.dll /threads)

Under: Linker\Input

Additional Dependencies	libiomp5md.lib

Below is a summary of the Intel compiler suite and Visual Studio versions that are known to work.

Intel Compiler Versions Tested

- Intel 15
- Intel 19.3
- Intel 19.4

Visual Studio Versions Tested

- 2015
- 2019 (Preview 4)

1.1.2 Running

Running EFDC+ on a local computer can be done in several different ways. By far the simplest way is to use the EFDC Explorer. The EFDC Explorer is a Graphical User Interface (GUI) that allows EFDC+ models to be visualized and run with ease. Details on the EFDC Explorer can be found here. Alternatively, the EFDC executable can be run through the command prompt or using a batch script.

For this discussion it is assumed the user is not using the EFDC Explorer.

Execution Options

EFDC+ can be run simply on a single core of a user's desktop. Alternatively, if the executable was compiled with OpenMP, multiple cores on a single machine may be utilized.

Tip: Running with more than 4 threads typically does not yield significant computational savings.

Running through the Command Prompt

Once an EFDC+ executable is available, it can be run directly through the command prompt or through simple batch script. A sample of batch script is given below:

```
SET KMP_AFFINITY=granularity=fine,compact,1,0

TITLE Sample Title of the Problem

CD "C:\Path\To\WorkingDirectory\"

"C:\Path\To\Exectuable\EFDCPlus.exe" -NT2 -NOP
```

Each line the script is described in greater detail below.

- SET KMP_AFFINITY=granularity=fine,compact,1,0 - Specifies an environment variable that binds OpenMP threads to physical processing units. This generally gives the best performance. For additional information on what this environment variable is doing, go to this article, written by Intel.
- TITLE: A title is optional but can be helpful if you are running multiple calculations at the same time. This title will show up at the top of the command prompt.
- CD: This command precedes the location of your *Working Directory*, which is the folder containing your EFDC+ inputs.
- The path to the location of the executable must be known and specified in the script.
- -NT2: This command line argument after the executable specifies the number of threads to use. In this case only 2 are requested, but one could easily specify 3,4,5, etc. to run more threads.

Important: Do not specify a number of threads greater than the number of logical cores available on your computer.

1.2 Cartesian Grid Generator User Guide

A simple GUI has been provided to help generate and visualize EFDC+ grids. Additionally, this grid generator can write out the basic input file necessary for running EFDC+. Next, an overview of how to use this grid generator will be provided.

To launch the grid generator open the `GridGenerator.exe` executable under the folder `GridGenerator`.

The interface of the tool is shown in Figure 1. To create a grid, the user can click *File* then select *New Model* or click the grid symbol from the interface as shown in Figure 2.

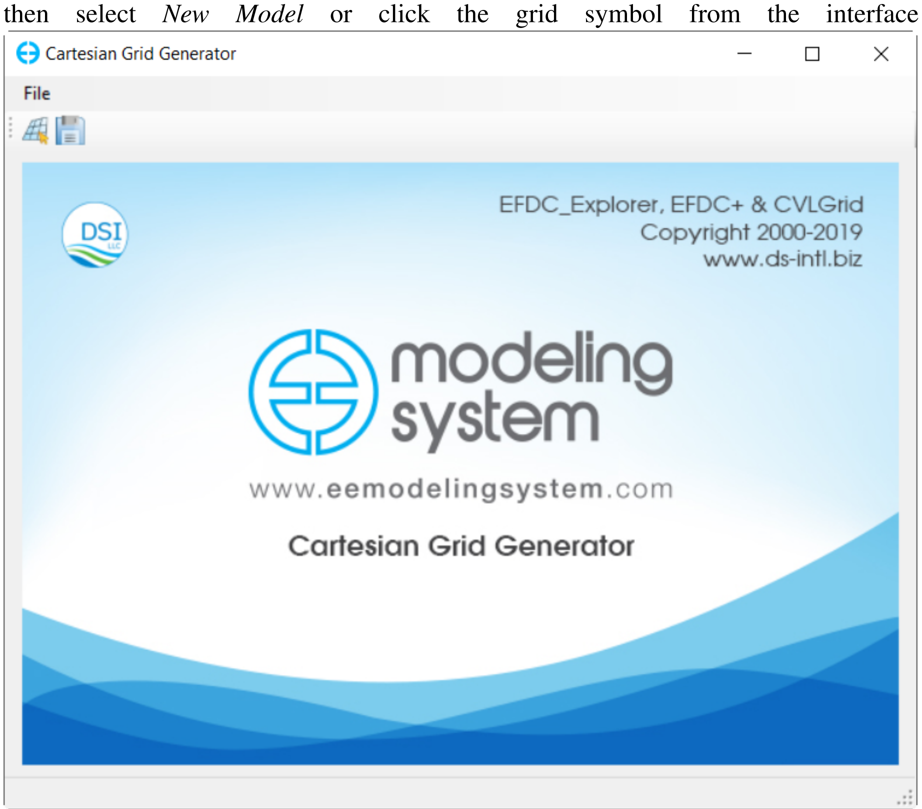

Figure 1. Cartesian Grid Generator Interface.

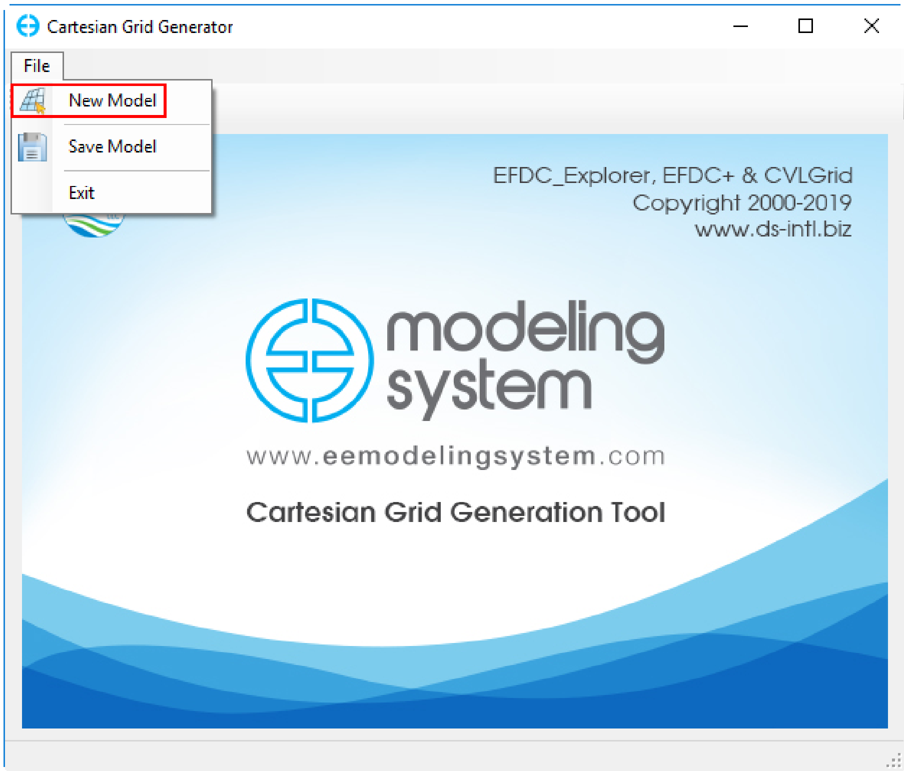

Figure 2. Create a New Model.**

The *Grid Generator* form will be displayed as shown in Figure 3.

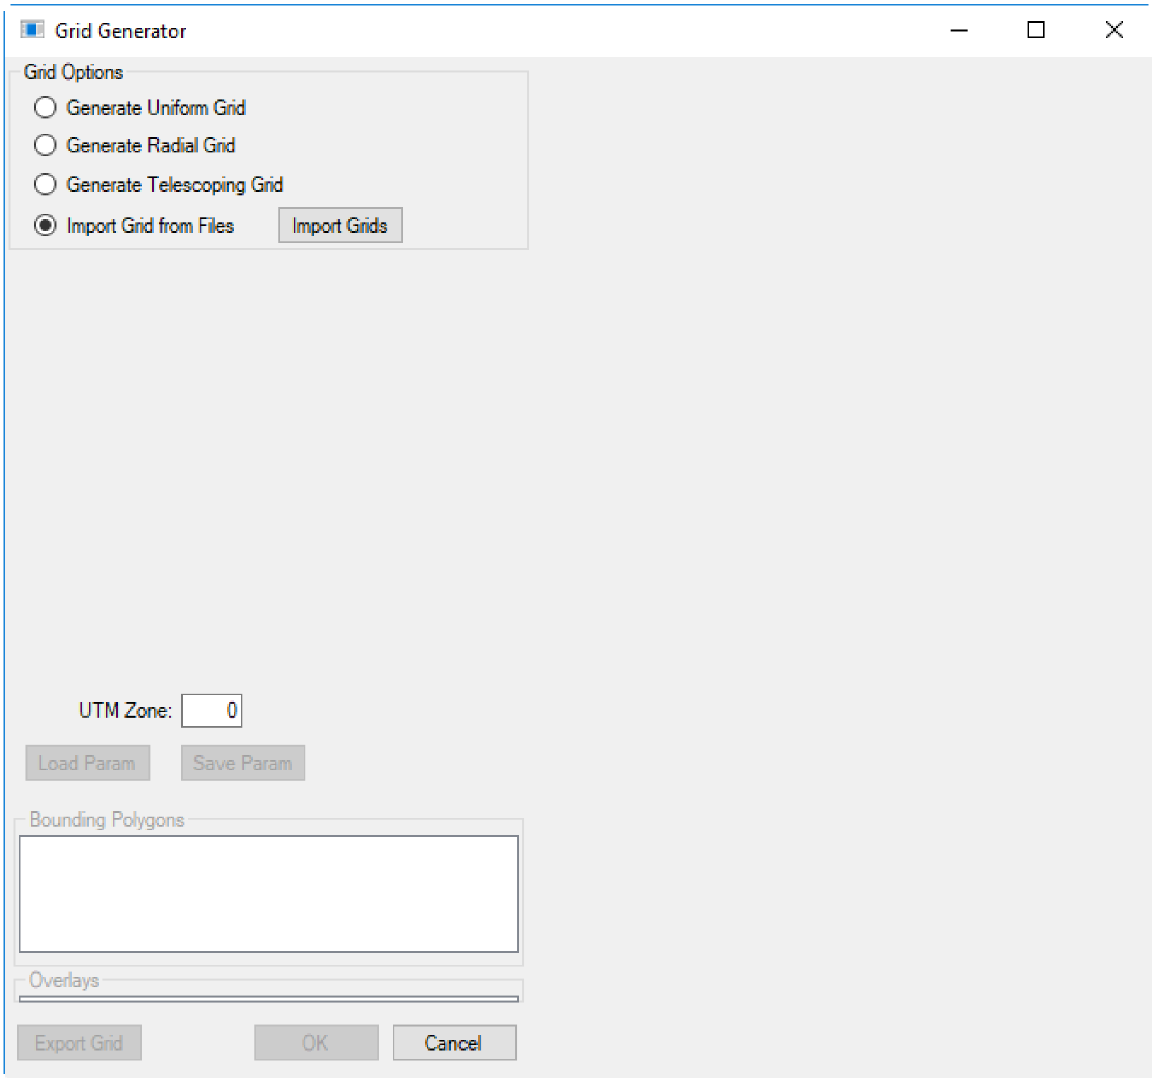

Figure 3. Grid Options.

There are three options for generating a new grid and one option for importing existing grid files. The options are: *Generate Uniform Grid, Generate Radial Grid, Generate Telescoping Grid,* and *Import Grid from Files.* Each of these options is described below:

1.2.1 Generate Uniform Grid

This option allows user to generate a Cartesian grid. When the radial button for this option is selected, the *Uniform Grid Options* frame is shown. In this frame the user needs to enter the *Lower-Left* and *Upper-Right* coordinates, these two corner points will temporarily limit the grid domain. Next, enter cell size in X and Y directions, which will define cell dimensions (width and length in meters of a cell), then click the calculator symbol for *Number of Cells*, the number of cells will be updated. Another option is that the user enters the number of cells desired first then click the calculator symbol for *Cell Size*, and the dimensions of the cell will be updated.

Rotation Angle: The user should enter angle in degrees which for the grid should be rotated.

UTM Zone: This is the Universal Transverse Mercator (UTM) zone, the user can enter the zone number, from 1 to 60.

The user can then click the *Generate* button, and the grid will appear on the right window as shown in Figure 4.

The user can also change the size of the domain by holding left-mouse click (LMC) on navigation points (P1, P2, P3, P4) and shifting to another place in the window. The values of fields of the *Uniform Grid Options* frame are updated as well.

To save the information entered into the *Uniform Grid Options* frame select the *Save Parameters* button. A *Save As* form will be displayed in order to enter a file name, then click the *Save* button to save as shown in Figure 5. This parameter settings file can be reused at another time by clicking on the *Load Param* button.

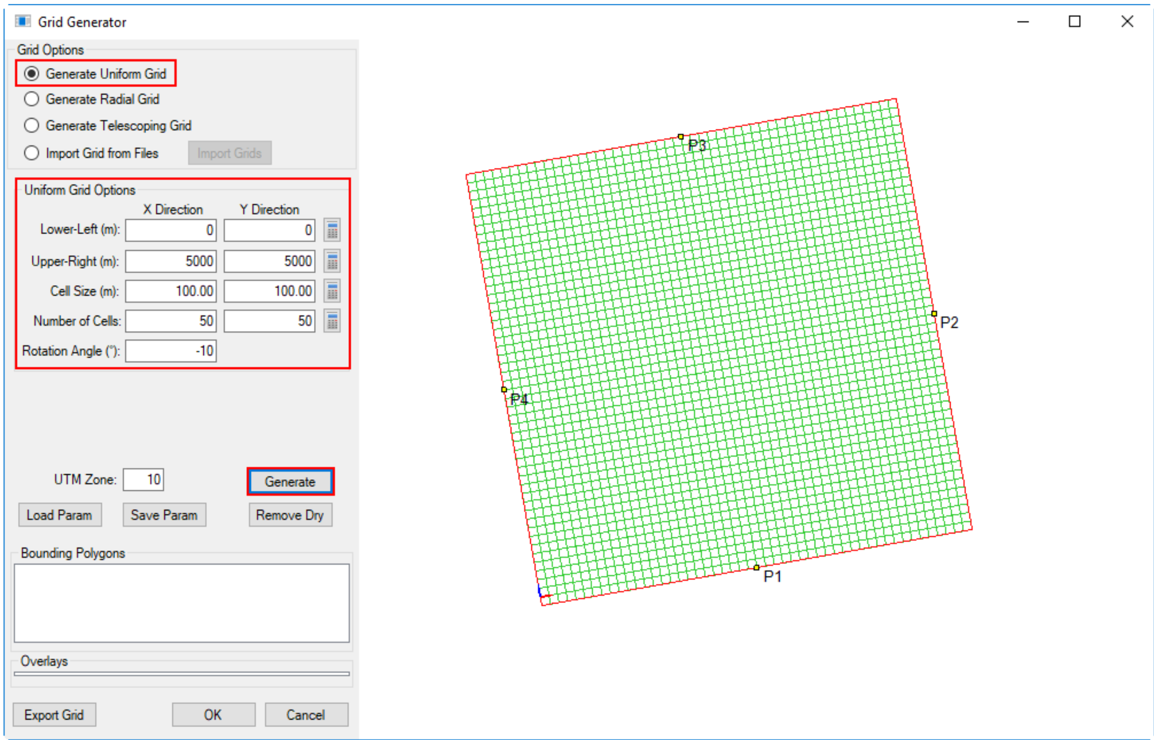

Figure 4. Generate Uniform Grid.

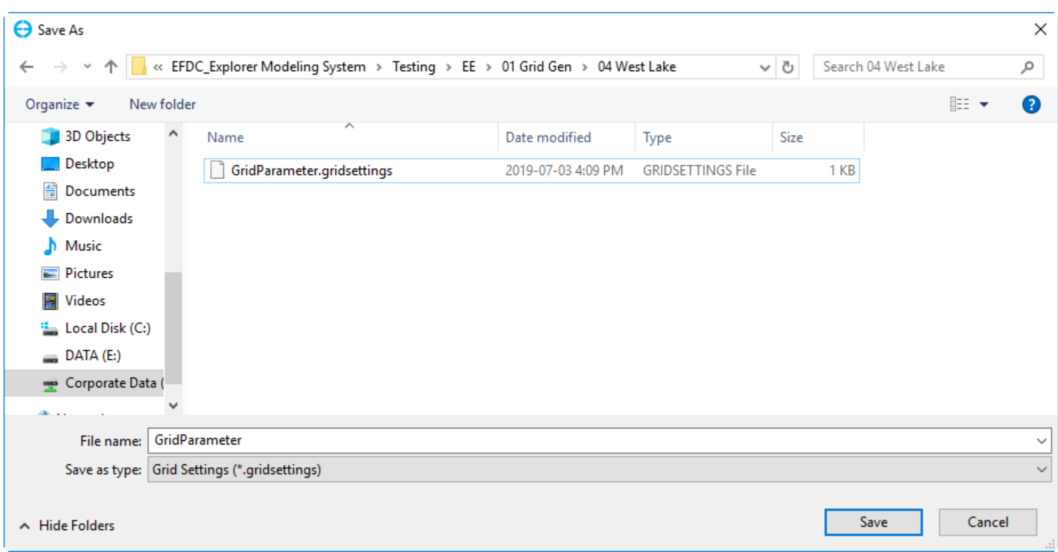

Figure 5. Save parameters.

To restrict the size of the domain use a bounding polygon, which is effectively serves as a shoreline. RMC on the *Bounding Polygons* text box and select *Add Files*. The *Open* form appears, and the user should select the file or files needs then click *Open* button as shown in Figure 6.

The polygon will be loaded and the *Lower-Left*, *Upper-Right* coordinates will be updated. The user now can generate a grid based on either cell size or the number of cells by clicking the *Generate* button. It is also possible inverse the selection, or remove the cells which are outside of the bounding polygon, by clicking the *Remove Dry* button as shown in Figure 7.

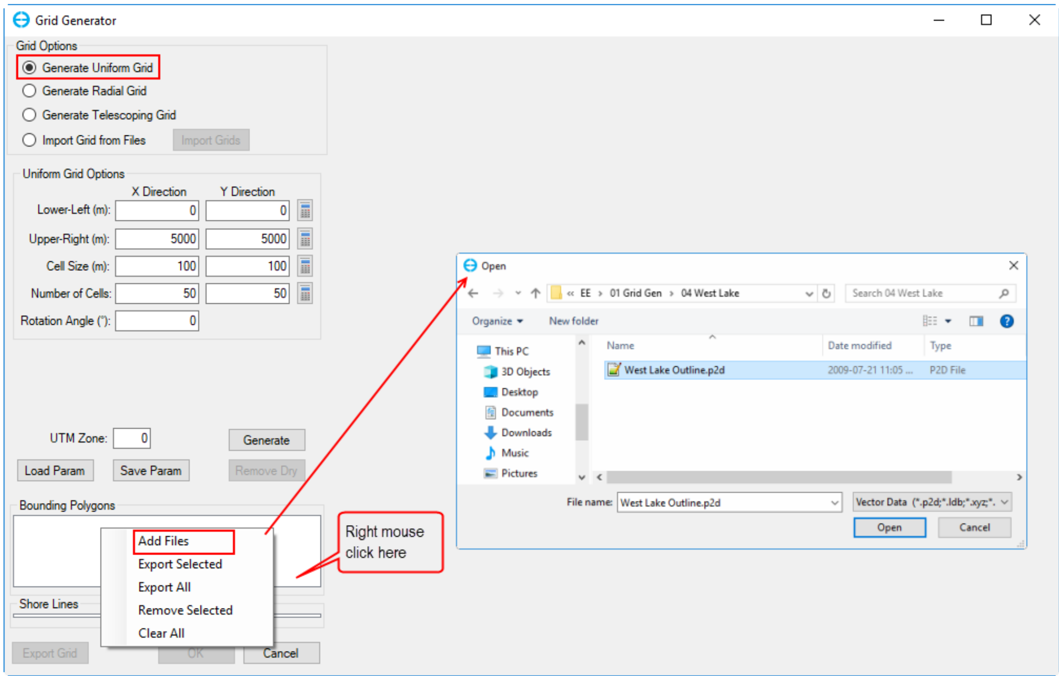

Figure 6. Load bounding polygon file.

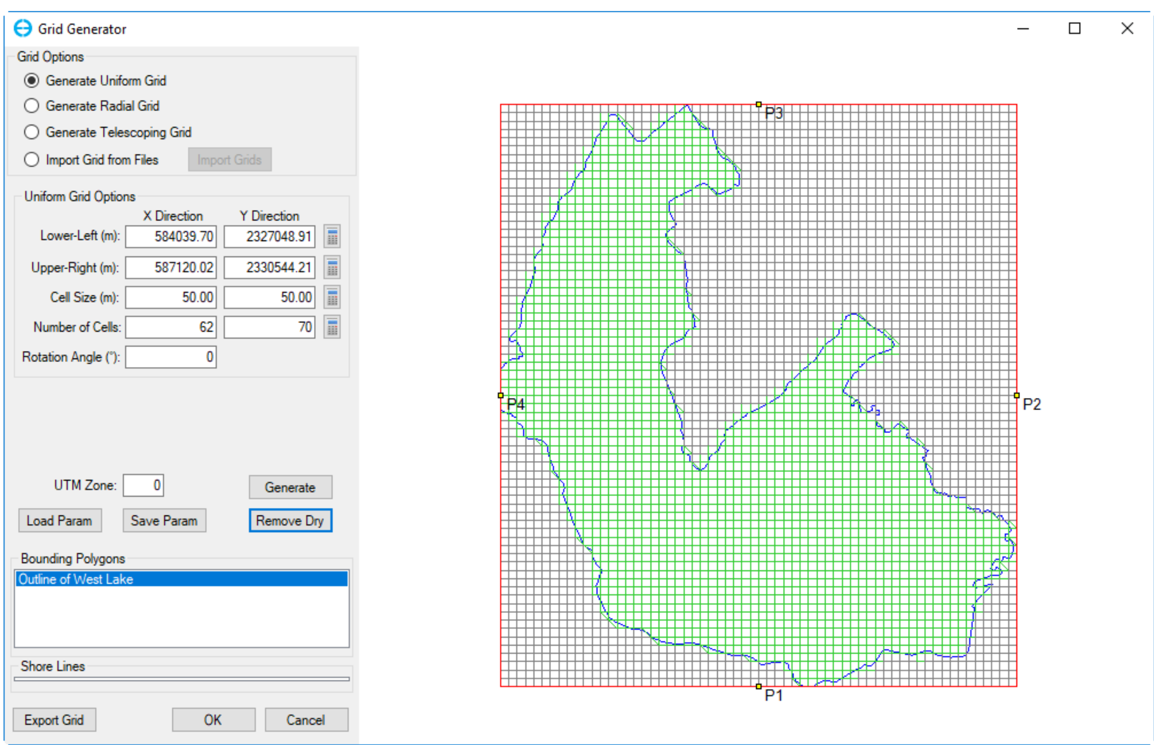

Figure 7. Grid generation by using bounding polygon.

Once the grid is generated, the user can save the grid by clicking the *Export Grid* button. The grid can be exported as *.CVL *or* *.GRD format. Click the *OK* button to finish generating the uniform grid.

After clicking *OK* button, the tool returns to the interface shown in Figure 1. Select the disk symbol or *Save Model* under *File* from the interface to save an EFDC+ model for this grid as shown in Figure 8. The files that saved are shown in Figure 9 and can be loaded by EE10.

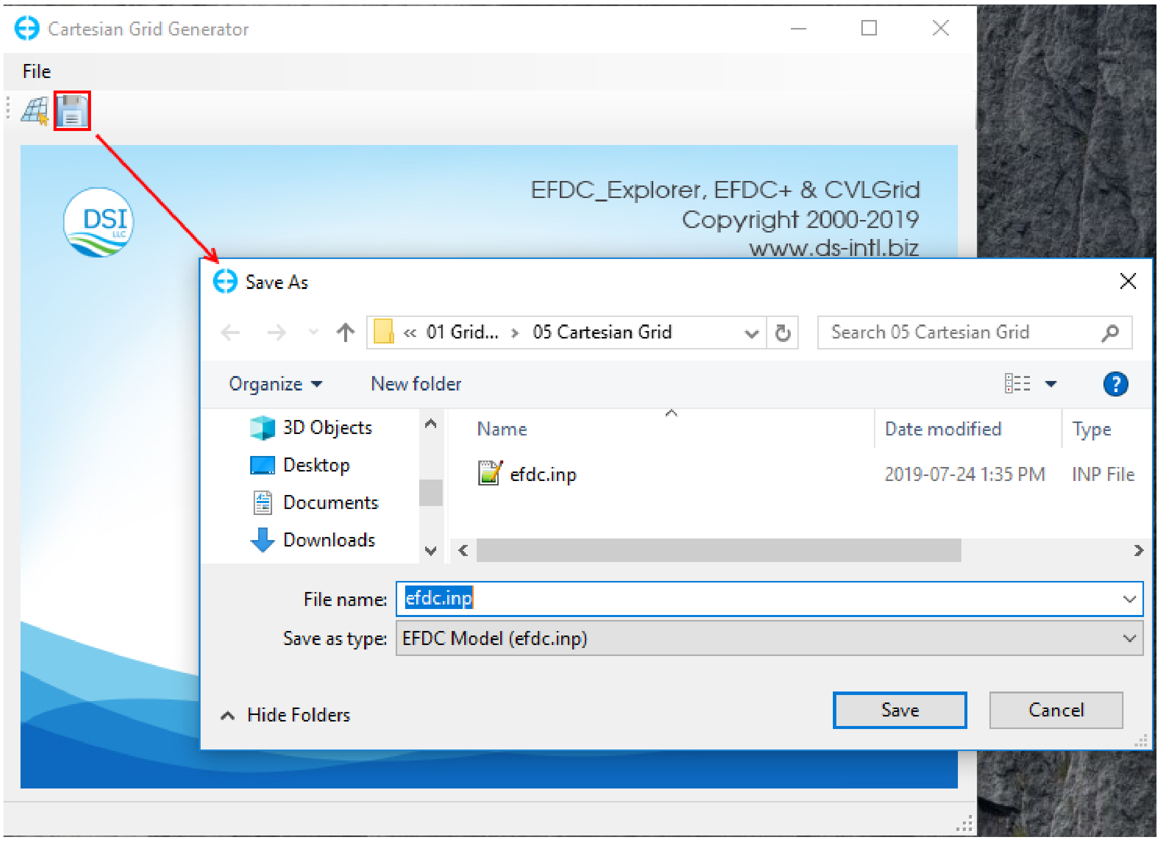

Figure 8. Save EFDC Model for generated grid.

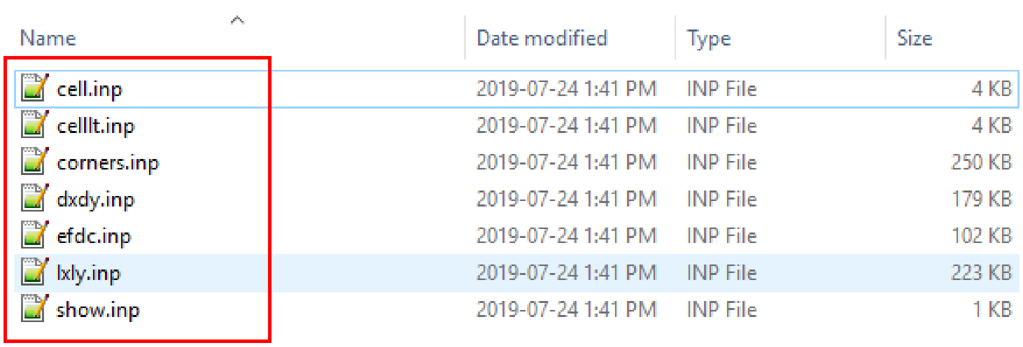

Figure 9. Files of EFDC Model save out.

1.2.2 Generate Radial Grid

When you select the *Generate Radial Grid* from *Grid Option* frame, the default values are filled in the *Radial Grid Options* frame as shown in Figure 10. The user can define those values as required.

The user can then click the *Generate* button, and the grid will appear on the right window as shown in Figure 10.

Export the generated grid and save the EFDC model in same way described in the section, *Generate Uniform Grid*.

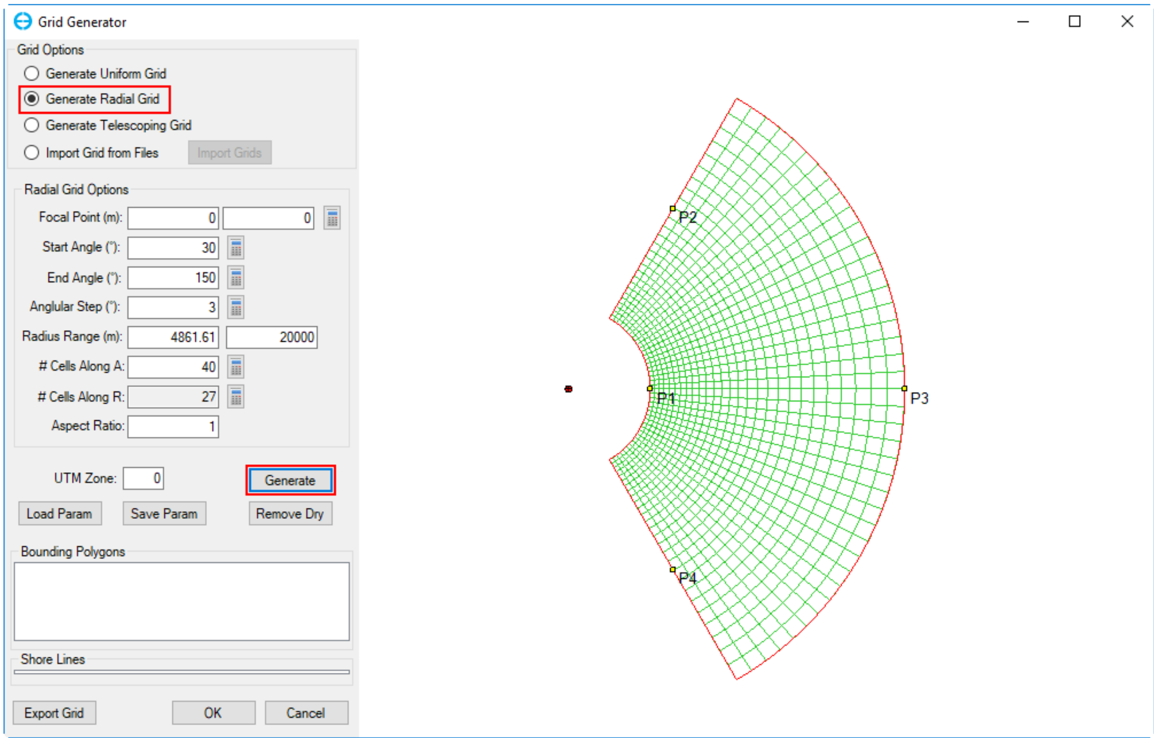

Figure 10. Generate Radial Grid.

1.2.3 Generate Telescoping Grid

When you select *Generate Telescoping Grid* from *Grid Option* frame, the default values are filled in to the *Telescoping Grid* frame as shown in Figure 11. The user can define those values as required.

Select the *Generate* button, and the grid will be displaye in the window as shown in Figure 11.

Export the generated grid and save the EFDC model as described in *Generate Uniform Grid* above.

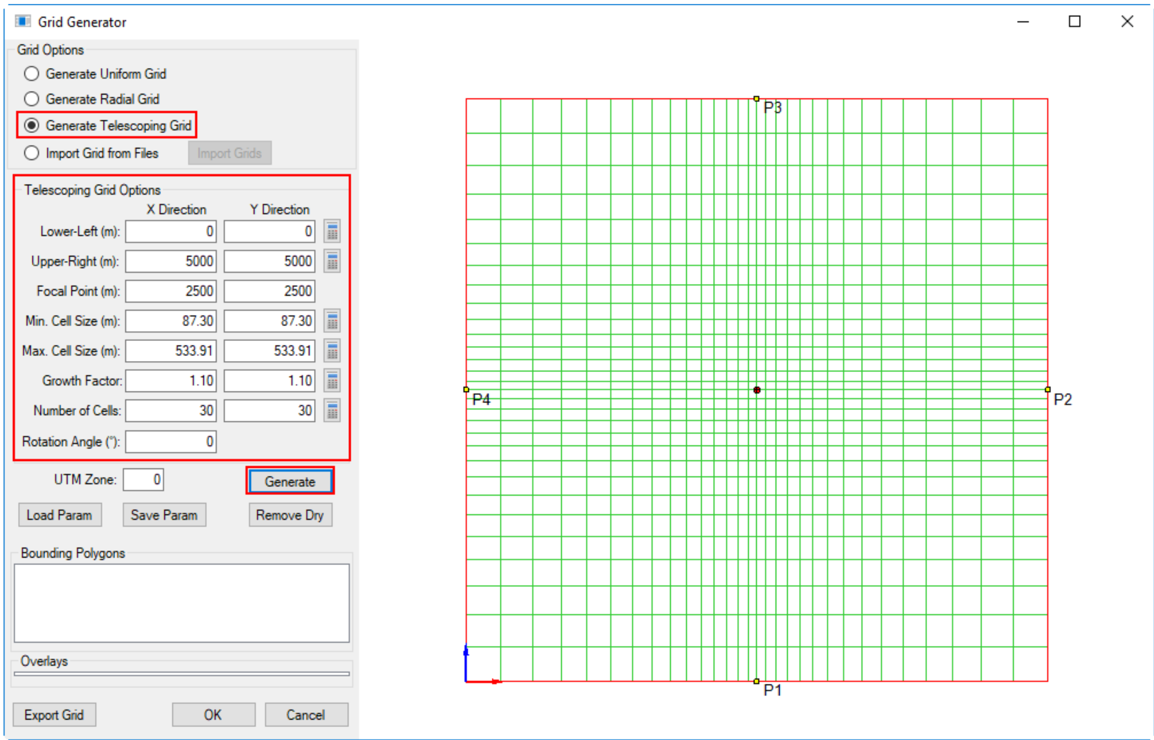

Figure 11. Generate Telescoping Grid.

1.2.4 Import Grids from Files

This option allows user to import an existing grid file. Grid file formats that are supported include:

- CVLGrid: CVL Grid information
- RGFGrid
- Grid95
- DXDY/LYLY: EFDC+ grid descriptors.
- ECOMSED
- SEAGRID
- CH3D
- Corners (4): EFDC+ grid descriptors.

The user should click the *Import Grids* radial button, and the *Import Grid* form will be displayed. From here the user should select the grid type from the drop-down list of *Grid types* as shown in Figure 12, then click the *Browse* button to browse to the grid file, and click *OK*.

In the case that there are a number of sub-grids for a water body, the *Multiple grid files* option needs to be checked, then the user may browse to the folder containing the grid files. To select multiple grid files at same time, hold the *Ctrl* key and select the grid files then click the *OK* button to load grid files (see Figure 13 and Figure 14).

Save the EFDC model in the same way described in section *Generate Uniform Grid*.

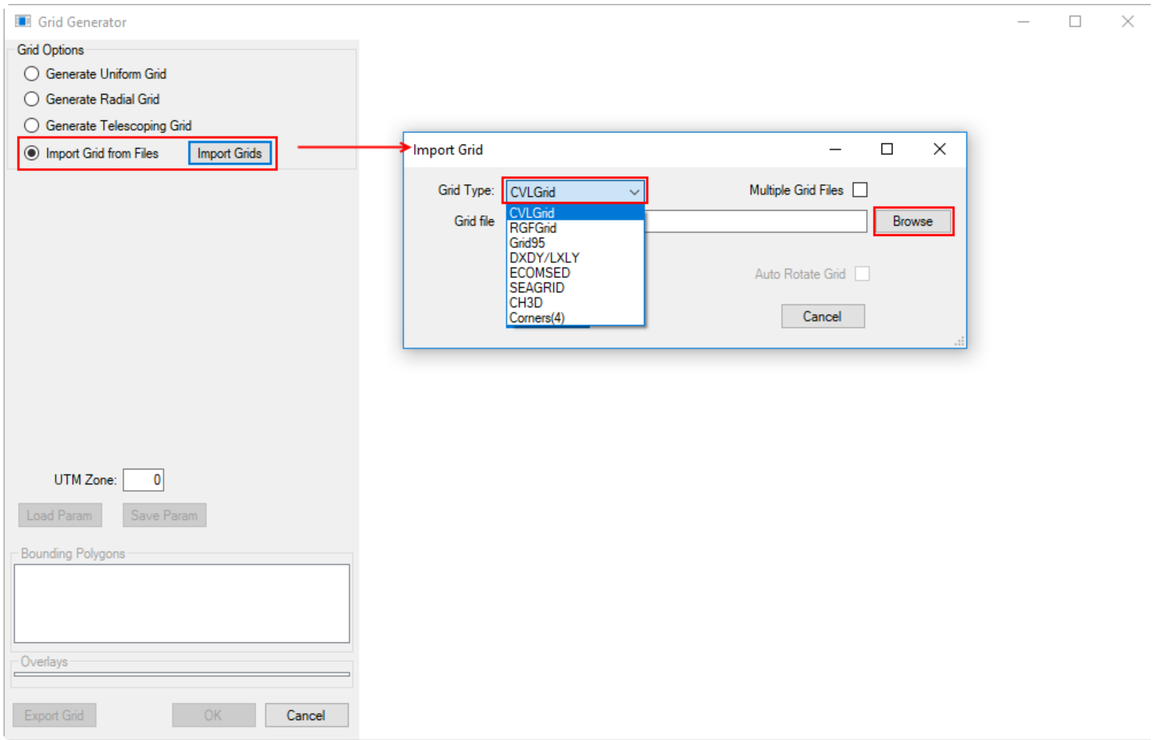

Figure 12 Import from a grid file.

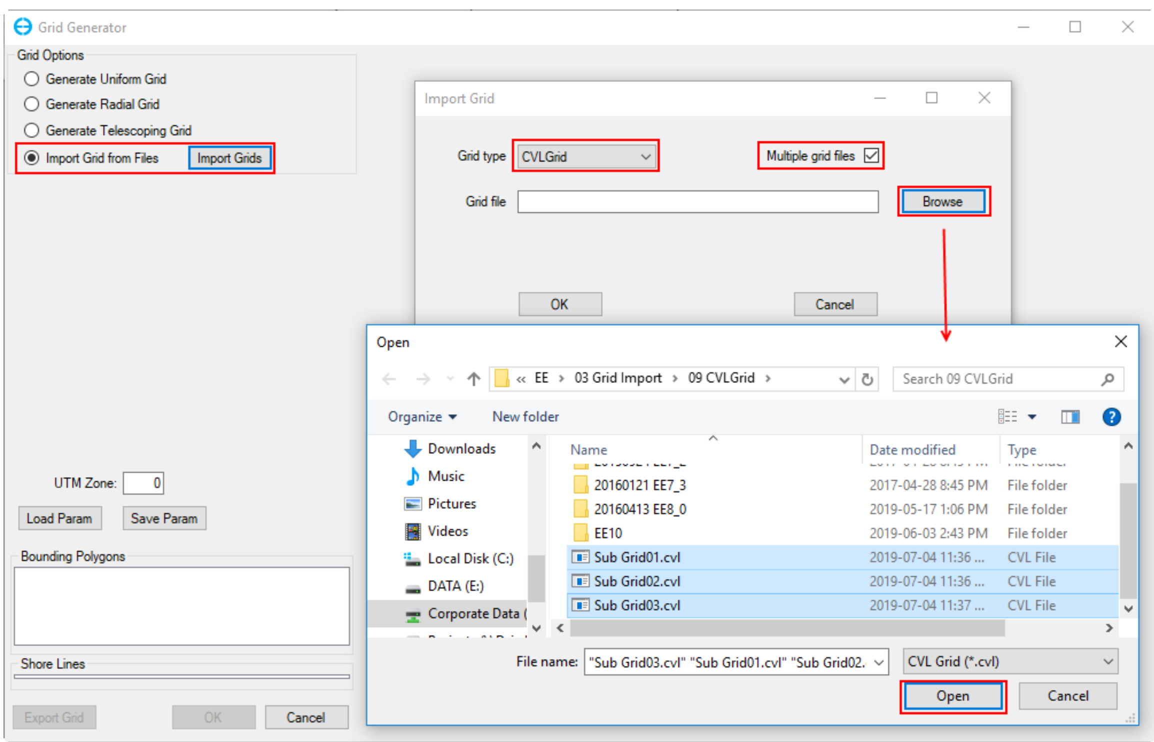

Figure 13. Import from multiple grid files – file selection.

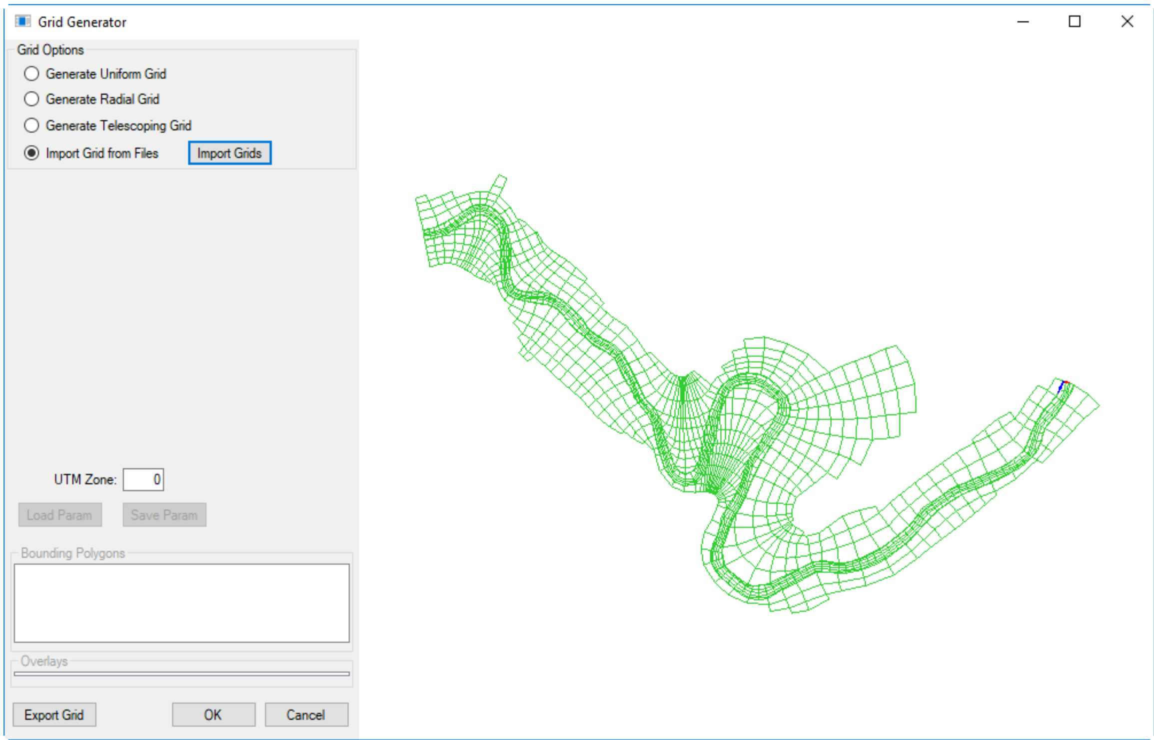

Figure 14. Import from multiple grid files – result display.

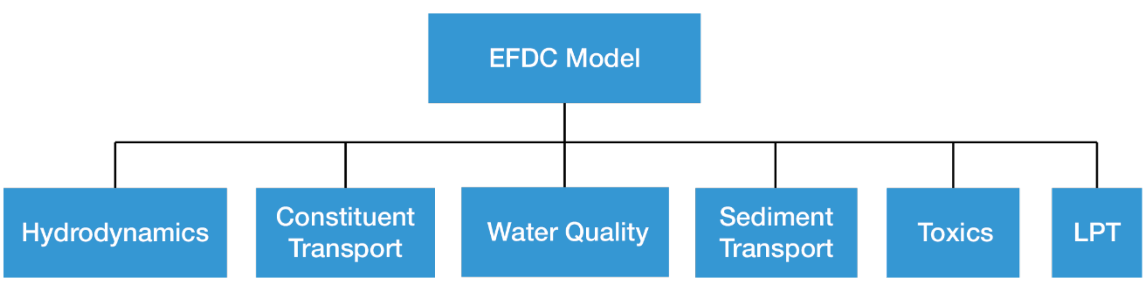
Note that the user should update the *UTM Zone* to the correct value before clicking the *OK* button to generate a new model. The *UTM Zone* is not used for model computation but it is important for coordinate conversion, exporting to GIS formats, writing NetCDF outputs, and for downloading online data in EEMS10.

1.3 Input Files

This section lists and describes the input files required to run different modules within EFDC+. The primary modules within EFDC+ are distinguished in the figure below.



1.3.1 Run Control

The run control files contain options to specify calculation types, time step sizes, output options, and other related controls. The most important of these files is the efdc.inp file and will be explained in detail later on.

Input File	File Description
efdc.inp	master input file
wq3dwc.inp	water quality input
wq3dsd.inp	sediment diagenesis
wqrpem.inp	RPEM settings

Restart Related Files

The restart files allow an EFDC+ calculation to start up from a specified time step part way through a calculation. Use of these files may be necessary if a calculation ended prematurely and a user wishes to restart from the last saved time step.

Input File	File Description
restart.inp	hydrodynamic restart
rstwd.inp	wetting & drying
temp.rst	bed temperature restart
wqwcrst.inp	water quality restart
wqsdrst.inp	sediment diagenesis restart file
wqrpemrst.inp	rooted plant & epiphyte

EFDC.INP

The efdc.inp file is extensive and specifies all options for running a calculation. Historically, the options were organized by card types. As such, each card description and input parameter is given below. Each of these cards is placed in a single efdc.inp file and read in by EFDC+ at run time.

Note, when creating and efdc.inp file a line starting with * or - will be ignored and interpretted as a comment.

1.3.2 Hydrodynamics

File Input	Description
cell.inp	Describes the cell mapping and which type of cell goes where.
celllt.inp	Auxiliary cell type file
dxdy.inp	Horizontal cell dimensions, depth, bottom elevation, roughness, vegetation class
lxly.inp	Horizontal cell center coordinates and cell orientation
corners.inp	Provides x,y coordinates corners for plotting in EFDC Explorer

File Input	Description
mask.inp	specifies thin barriers
mappgns.inp	specifies period grids along north-south or breaks in grid in north-south (J) direction
moddxdy.inp	modifies cell dimensions originally specified in dxdy.inp
atmmap.inp	atmospheric map if NASER>1
wndmap.inp	wind map if NWSER>1
pshade.inp	spatially varying solar radiation shading

The primary input files that specify the geometry of the problem are given in greater detail below.

Cell Input File

The cell.inp file is a 2x2 matrix with length in the *i* or *x* direction equal to *IC* and a length in the *j* or *y* direction of *JC*. IC and JC are specified on *card9* of EFDC.INP

In the table below each cell type is described. These numbers are what are inputted into the ICxJC matrix in the cell.inp file.

Cell Number	Description
0	dry land cell not bordering a water cell on a side or corner.
1	triangular water cell with land to the northeast
2	triangular water cell with land to the southeast
3	triangular water cell with land to the southwest
4	triangular water cell with land to the northwest
5	quadrilateral water cell
9	dry land cell bordering a water cell on a side or corner or a fictitious dry land cell bordering an open boundary water cell on a side or a corner

In the example file listed below IC=10 and JC=6. Note, the first 4 rows are comments as well as the first 4 rows. The cell mapping begins from the bottom left corner.

```
C cell.inp file, i columns and j rows
C    0         1
C    1234567890
C
  6  999999000
  5  945519999
  4  955555559
  3  955555559
  2  935529999
  1  999999000
```

DXDY Input File

The dxdy.inp file specifies many of the physical properties of each cell. Every cell described in the cell.inp file must be described in this file.

Variable	Description
I	Array index in x direction
J	Array index in y direction
DX	Cell dimension in x direction, meters
DY	Cell dimension in y direction, meters
DEPTH	Initial water depth, meters
BOTTOM ELEV	Bottom bed elevation, meters
ZROUGH	Log law roughness height, zo, meters
VEG TYPE	Vegetation type class, integer value

Below is part of a sample input file that specifies part of a single column of the geometry.

```

LXLY Input File

The lxly.inp file specifies the cell centered location and the rotation of each cell.

Variable	Description
I	Array index in x direction
J	Array index in y direction
X	x cell center coordinate, longitude, meters, or km
Y	y cell center coordinate, longitude, meters, or km
CUE	Rotation matrix component, i
CVE	Rotation matrix component
CUN	Rotation matrix component
CVN	Rotation matrix component
Wind Shelter	

Below is part of a sample input file that specifies part of a single column of the geometry.

1.3.3 Constituent Transport

1.3.4 Water Quality

File Input	Description
wqwcmap.inp	Maps an I,J,K water quality cell to a water quality zone
wqs-dmap.inp	Maps an I,J water quality cell to a sediment flux zone
algaegro.inp	Time and spatially varying algal growth kinetic factors
algaeset.inp	Time and spatially varying algal and particulate organic matter settling rates and reaeration adjustment factor

1.3.5 Sediment

These files describe the files necessary to specify the initial conditions for a model.

Input File	Description
salt.inp	Initial concentrations for the salinity
temp.inp	Initial concentrations for the temperature
dye.inp	Initial concentrations for the dye
sedw.inp	Cohesive Sediment water column
sndw.inp	Non-Cohesive Sediment water column
sedb.inp	Cohesive Sediment bed
sndb.inp	Non-Cohesive Sediment bed
pocw.inp	Particulate organic carbon water column
pocb.inp	Particulate organic carbon bed
docw.inp	Dissolved organic carbon water column
docb.inp	Dissolved organic carbon bed
fpocb.inp	Fractional particulate organic carbon bed
fpocw.inp	Fractional particulate organic carbon water column
wqwcrst.inp	Spatially/temporally varing ICs
wqsdici.inp	Spatially/temporally varing ICs
wqsdrst.inp	Spatially/temporally varing ICs
wqrpemsic.inp	Rooted plant

1.3.6 Toxics

toxw.inp Toxic water column toxb.inp Toxic bed

1.3.7 Lagrangian Particle Tracking

Input File	Description
qctl.inp	Hydraulic control structures
gwater.inp	Groundwater interaction
vege.inp	Vegetation resistance definitions
wavebl.inp	Wave-current boundary layers
wavesx.inp	Wave induced currents
drifter.inp	Lagrangian Particle Tracks

1.4 Output Files

This section describes the binary output files produced by EFDC+ during a calculation.

1.4.1 Output Files

These output files are written out by EFDC+ in a binary format. The easiest way to view the results is using EE Modeling System (EEMS). A demo of EEMS is available and can be accessed by going to the EEMS website. Alternatively, a rudimentary postprocessing tool is available, referred to as *GetEFDC*. *GetEFDC* is a Fortran 90 program that can read the binary formats and can be modified to output into another format like a text file. A detailed description of *GetEFDC* is found on the next page.

In the table below each of the binary output files is listed and described.

Output file name	Description
EFDC	Displays the contents of EFDC.INP as interpreted by EFDC+
EE_HYD.OUT	Water depth and velocity
EE_WC.OUT	Water column and top layer of sediments
EE_BC.OUT	Efdc computed boundary flows
EE_BED.OUT	Sediment bed layer information
EE_WQ.OUT	Water quality information for the water column
EE_SD.OUT	Sediment diagensis information
EE_RPEM.OUT	Rooted plant and epiphyte model
EE_SEDZLJ.OUT	Sediment bed data for sedzlj sub-model

1.4.2 GetEFDC

GetEFDC is a Fortran utility to read the binary output files produced by EFDC+. *GetEFDC* is a rudimentary tool and shouold not be used for complex model output analysis. It is expected that a user utilizing this tool has knowledge of Fortran and can modify *GetEFDC* to meet specific needs.

EE_WQ.OUT and EE_DRIFTER.OUT are the optional outputs based on the terms activated in EFDC model, in which EE_WQ.OUT is the output for water quality and EE_DRIFTER.OUT is for Lagrangian particle tracking simulations. When KB > 1 (set in efdc.inp) then EE_BED.OUT is also available.

Source Code

The source code for *GetEFDC* is listed below. It written all in Fortran and is straightforward to compile with a modern compiler (e.g. gfortran or Intel).

Main program:

- getefdc.f90

and 8 Modules:

- infomod.f90
- efdcpromod.f90
- tecmod.f90
- geteeoutmod.f90
- xyijconv.f90

- gethfreqout.f90
- globalvars.f90

For 083_OMP, if IGRIDV > 0 then the output is based on the vertical layer defined in sgxlayer.inp / SGZLAYER.OUT.

Build GetEFDC

A `makefile` is located under the /GetEFDC/src directory. This can be used to compile on a Linux machine. Alternatively, this program can be compiled on Windows using Visual Studio.

Running GetEFDC

The syntax for running the utility is as follows:

```
GetEFDC.exe getefdc.inp
```

Input File

`getefdc.inp` is the master file that stores all the information about the parameters of interest which the user is trying to extract. This file must be edited for every change to input parameters. A sample of the master file is included in the GetEFDC folder. The input parameters in this file are as follows:

- The full path of the folder containing `efdc.inp` file
- LAYK The number of layer in the vertical to get data for 2DH display (>0)
  - = 0 Extract the depth-averaged data
  - >0 Extract the data at layer of k
  - =-1 Extract High Frequency output
  - =-2 Extract data for time series (TS) at a height above bed (m)
  - =-3 Read TMP.DAT file and write an array data file for TECPLOT
- ZOPT This parameter is used in case of LAYK=-2
  - =1 Extract TS data at the depth under water surface
  - =2 Extract TS data at the height above bottom
- JULTIME Julian time point for a selected layer, if > MAXTIME then JULTIME=MAXTIME JULTIME = 0 Extract data for all snapshots
- NLOC Number of locations (cells) to extract data. The location can be given as Index (I,J) or UTM coordinates (X,Y) via the parameter INDEX.
- ROTA The option for rotation of velocity components (U,V)
  - = 0 Extract (U,V) without rotation
  - = 1 (U,V) components are rotated to the true east and true north directions
- INDEX
  - = 0 UTM (X,Y) of cells are used
  - = 1 Indices (I,J) of cells are used
- VPROF The option to extract data for vertical profile, 0 (No)/ 1(Yes)

- TECPLOT The option to extract data for 2DH Tecplot, 0 (No)/ 1(Yes)
- NDRIFTER: A successive set of number of particles to extract data for (X,Y,Z)
- I/X I Indices or X abscissa of cells to extract data
- J/Y J Indices or Y coordinates of cells to extract data
- ZINT Height under water surface or above bed to extract data in case LAYK=-2

Please note that the lines which start with ** in the `getefdc.inp` file are comments and will be ignored.

```

Output Files

After running GetEFDC a sub-folder `RESULT` is generated in the folder `#output` of the working model. The extracted files are ASCII with the following conventions for the file names:

- First characters group shows the constituent, such as SAL for salinity
- Second character group is *TSK_* which is the time series of the layer K, such as *TSK_4* is time series for the layer K=4
- The last character group is _DOM for the domain or CEL for the selected cells
- The vertical profiles for the constituents at the selected cells use the group _PROF in the file names, such as `SAL_PROF.DAT`

1.5 Sample Models

Below are some sample models that can be run with EFDC+ and contain completed input files.

1.5.1 Square Harbor Test Case

A sample model, referred to as the *Square Harbor*, taken from [Bijvelds1999] is provided.

The model has 2,782 horizontal grid cells and 10 vertical layers

Information about the model can be found in the following folders.

- `SquareHarbor\Data`: This folder contains data that can be used with the model. These data can be measured data or output from model or derived from analytical equations.
- `SquareHarbor\Model`: EFDC model that can be run.

Disclaimer: The model is provided to our users to demonstrate that EFDC_Explorer and EFDC+ can be used to accurately represent models in the literature. The measured data provided in the data folder can be used to compare the U and V components of velocity from the model. The model is running fine with reasonable agreement to measured velocity. This shouldn't be considered as a final product as the model can be improved / refined to get improved results
